from trees. Besides the *kambara* other species including the small stingless bee supply a considerable quantity. The first two months of our sojourn in the Vedda country (January and February) was at a time when honey was particularly scarce, and even at the end of March and in April it was not abundant, yet such was the courtesy of the Veddas that each community managed to make us a small present of honey, though this often entailed a long search and the combs were frequently full of grubs. In two communities only, which were better off than the others, namely Danigala and Kulukalaeba, were we given large pots of strained honey, the remains of the previous year's store.

The manner in which *kambara* colonies are regarded as property has been discussed in Chapter v. Writing in 1886 Nevill says, "Honey forms a great part of their diet. It is eaten fresh in large quantities, wax and all; combs with young bees in them being considered especially wholesome. It was also the practice formerly to store strips of dried meat in honey, filling in a cavity of some tree with it, the cavity being first lined with clay. At present they barter away their surplus meat and honey, during the hunting season, and keep no store for the rainy season. This often brings privation and is one cause of the rapid decrease in their numbers.

"They tell me their health is never so good as when their food largely consists of yams and honey.

"To procure honey they rapidly cut open hollow trees, even of the hardest wood; and to take the hives of the large black bambara bee, they make long ladders of cane, called 'rang kendiya,' by which they descend precipices, and cut off the combs adhering to their sides.

"They do this at night, generally, as the bees are not so savage then; and smoke them with a sort of resin. The hives are often cut off with a sort of wooden sword, made for the occasion. These frail ladders swing fearfully, and the task is so dangerous, only the boldest and most athletic attempt it. While engaged on the task they sing lustily, songs specially made, which appease the spirit of the rock, and prevent him from dashing the hunter off the ladder. They also go about

the work with songs, so as to get up a certain degree of excitement, necessary to carry them through the task. A song is chanted, and a little honey sprinkled for the spirits, before the combs are cut off the rock[1]."

Fig. 19. *Maṭiya* × $\frac{1}{12}$.

Before honey collecting as many pots as possible are made and old pots and gourds are overhauled. The wooden sword which Nevill mentions is probably the *maṭiya* (fig. 12). This is a stout stick about 2½ metres long with four prongs at one end, which the Vedda carries hanging by a loop from his forearm and which he uses to detach the comb and convey it into the vessel called a *maḷudema* in which the honey is collected. This is also carried hanging from the forearm and should be made of deer's hide so that it may not be broken against the rocks as the honey collector swings to and fro. Plate LXV shows a *maḷudema* collected at Sitala Wanniya. An arrow is also carried and is largely used in detaching the combs from the rock.

Before taking the honey a bundle of green leaves is set alight and lowered in order to stupefy the bees. The smoker is called *soliya* (Sin. *kuḷa*) and the creeper attached to it *yotuvella*[2]. Several men of the community join together to collect rock-honey, the whole spoil being equally divided without any special consideration for the owner of the land, though it seemed that the owner would decide when the honey should be collected. The women accompany their men to crags and gulleys where the *bambara* build their combs. They hold torches and sing while the honey is being collected.

Plate LXVI shows a gourd, used as a hive for a colony of the stingless bee, hanging outside one
